

## ABSTRACT

5 A plasma display panel comprising plural kinds of phosphor layers  
emitting different colors of fluorescent light, at least one kind of the phosphor  
layer being formed of a mixed phosphor obtained by mixing a phosphor having  
a surface potential with a negative polarity and a phosphor having a surface  
potential with a positive polarity. By using the mixed phosphor, the negative  
polarity of the surface potential is changed to the positive polarity, thereby  
reducing the discharge error and discharge variation, and improving the  
10 quality of display.
